Appl. No. 09/271,411 Amdt. dated March 18, 2004 Reply to Office Action of September 22, 2003

Amendments to the Abstract:

Please replace the abstract on page 28 with the following amended abstract of the disclosure (second amendment to the ABSTRACT):

A device for analyzing a sample comprises a body having, a reaction chamber for conducting a reaction, a separation ehannel region for separating components of the sample, and a transition region connecting the reaction chamber to the separation ehannel region. The portion of the body defining the transition region has sufficiently low thermal conduction so that the transition region substantially thermally isolates the reaction chamber from the separation ehannel region. The device also includes at least one valve in the transition region for controlling fluid flow between the reaction chamber and the separation ehannel region. At least two electrodes are coupled to the body, the electrodes being positioned to induce the sample components to separate into bands drive electrophoretic, electroosmotic, or IEF flow in the separation ehannel region when a voltage difference is applied between the electrodes.
